

Answer Key:

Question 1:

- a) Procedural Memory (Type of Implicit Memory)
- b) Semantic Memory (Explicit Memory subtype)
- c) Semantic Memory

Question 2:

Duration and capacity difference (1 mark), Functional difference (1 mark), and relevant example for both (1 mark)

“Sensory memory briefly holds sensory information. Its duration is very short—iconic (visual) memory lasts about 0.25 seconds, and echoic (auditory) memory lasts 4–5 seconds. It has a large capacity but quickly fades unless attended to. Short-term memory (STM) stores information for 15–30 seconds with a limited capacity of about 7 ± 2 items. STM is used for conscious processing and temporary storage. For example, Sperling’s experiment demonstrates sensory memory, while repeating a phone number before dialing uses STM.

Question 3:

- a. IV – talking/not talking to the strangers
DV – happiness after the commute
- b. IV – usage of smart devices
DV – instances of yelling at the children
- c. Ratio, because BMI has equal intervals and an absolute zero
- d. Nominal, because the birth months do not have a ranked order

Question 4:

- a. Construct –social support
Operational definition - scores on the Multidimensional Scale of Perceived Social Support
Construct – Academic stress
Operational definition - scores on the self-reported Academic Stress Inventory
- b. IV – daily sugar intake level (Low, Medium, High)
Scale of measurement – ordinal

DV - blood glucose level
Scale – ratio
